MODERN APPLICATIONS EDITION

20 October, 2022

Building next-gen applications with event-driven architectures

Minh Yie

Enterprise Solutions Architect
Amazon Web Services

Agenda

- Challenges with distributed systems
- Solving these challenges with event driven architecture
- Journey to event-driven architectures with AWS services
- Recap and what's next

Challenges with distributed systems

Moving from monoliths to microservices

Monolith

Does everything

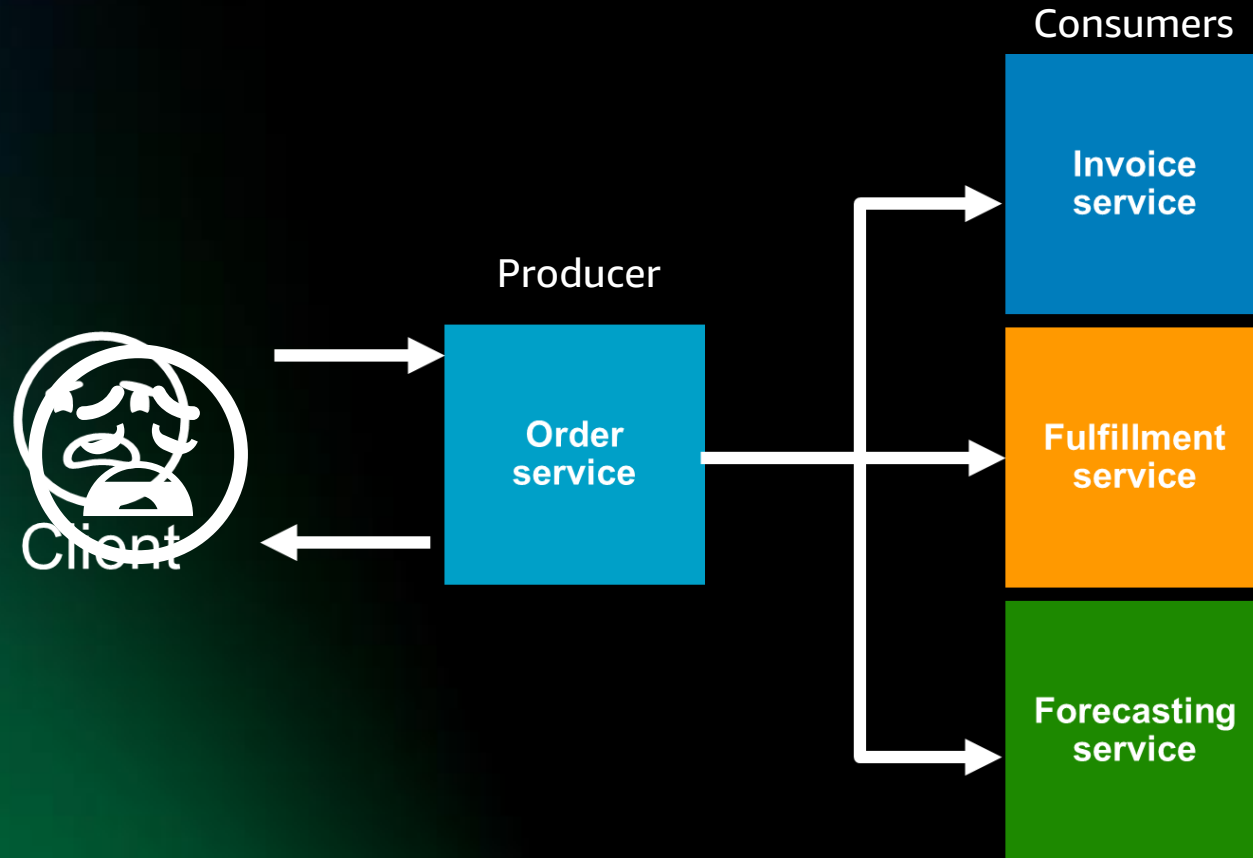

Microservices

Do one thing

Microservices start simple

Synchronous API challenges over time

Coupling between producers and consumers

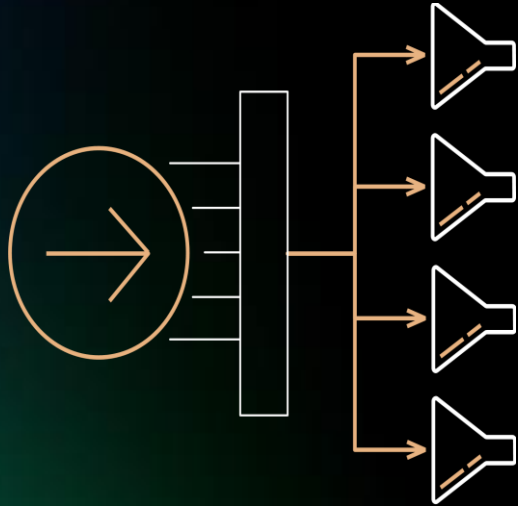

Multiple points of failure

Varying degrees of quality of service

External dependencies

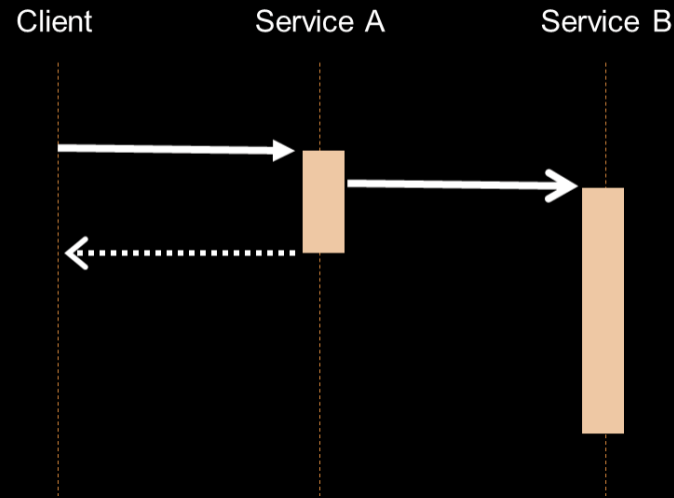

Solving these challenges with event driven architecture

Event-driven architecture components

Event routers

Abstract producers and consumers from each other

Asynchronous events

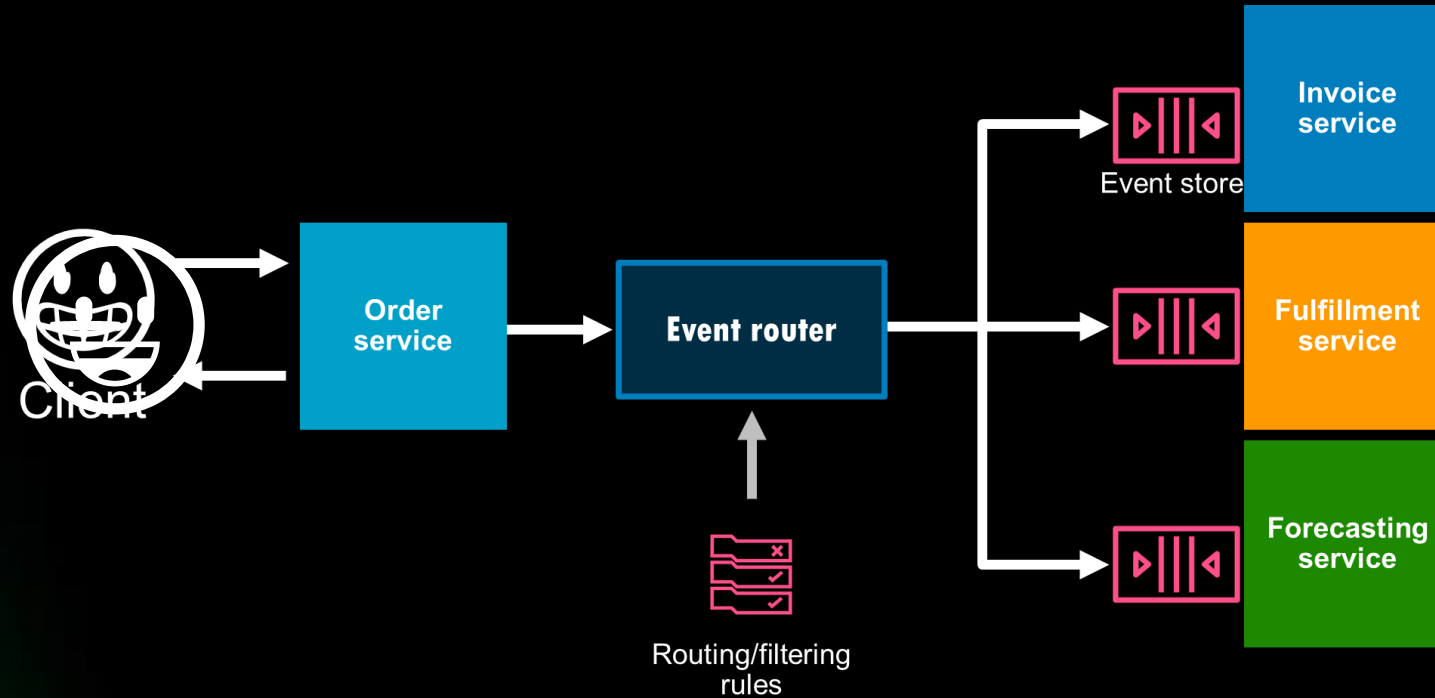

Improve responsiveness and reduce dependencies

Event stores

Buffer messages until services are available to process

Reliable, resilient, and independently scalable

[Make generic statement from customers]

Journey to event-driven architectures with AWS services

Journey to event-driven architectures

STEP 1

Start with the domain

Map events to **business domains** using **attributes**, not entities

OrderCreated

Retail

OrderPicked

OrderShipped

Fulfillment

ReturnRequested

ReturnReceived

Support

Journey to event-driven architectures

STEP 1

Start with the domain

STEP 2

Coordinate events
with an event router

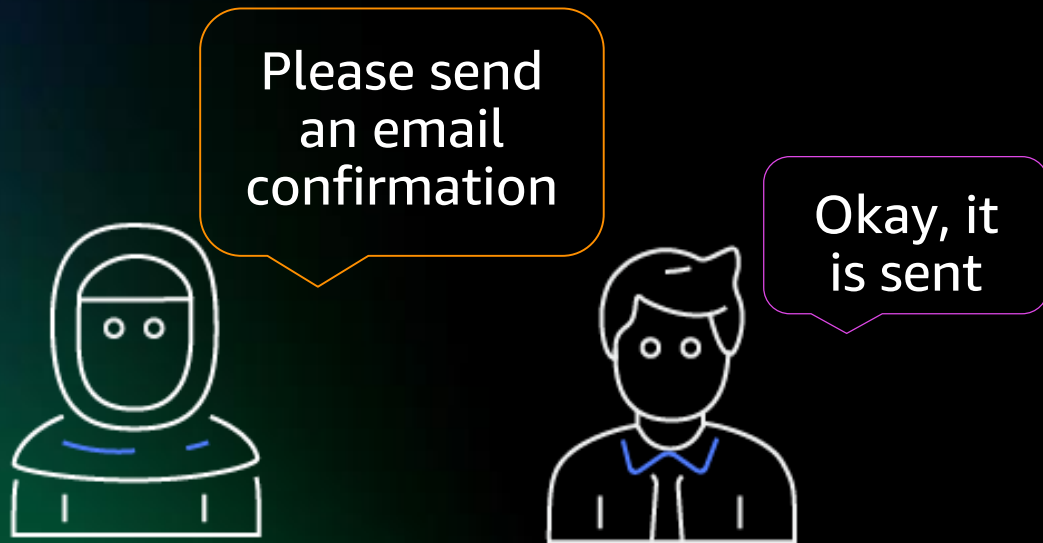

event

[i-'vent] noun

**A signal that a
system's state has
changed**

Events are observable, not directed

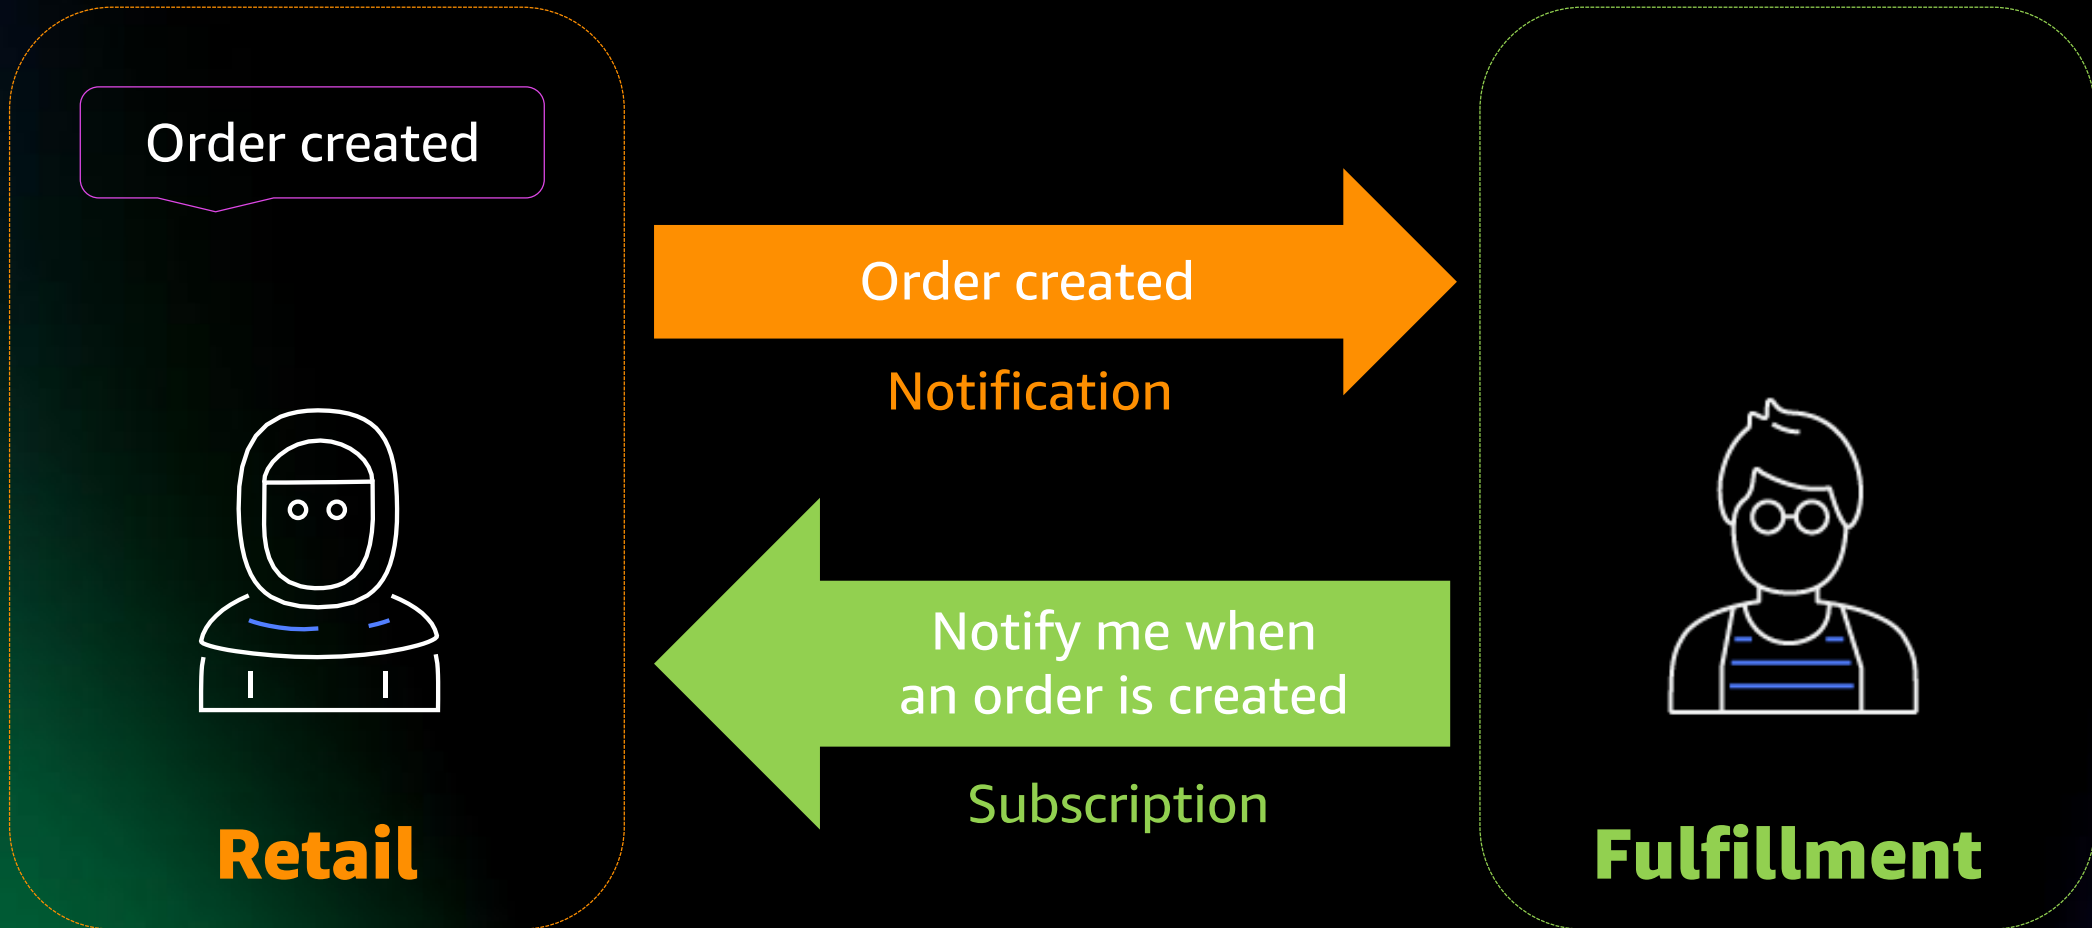

Directed commands

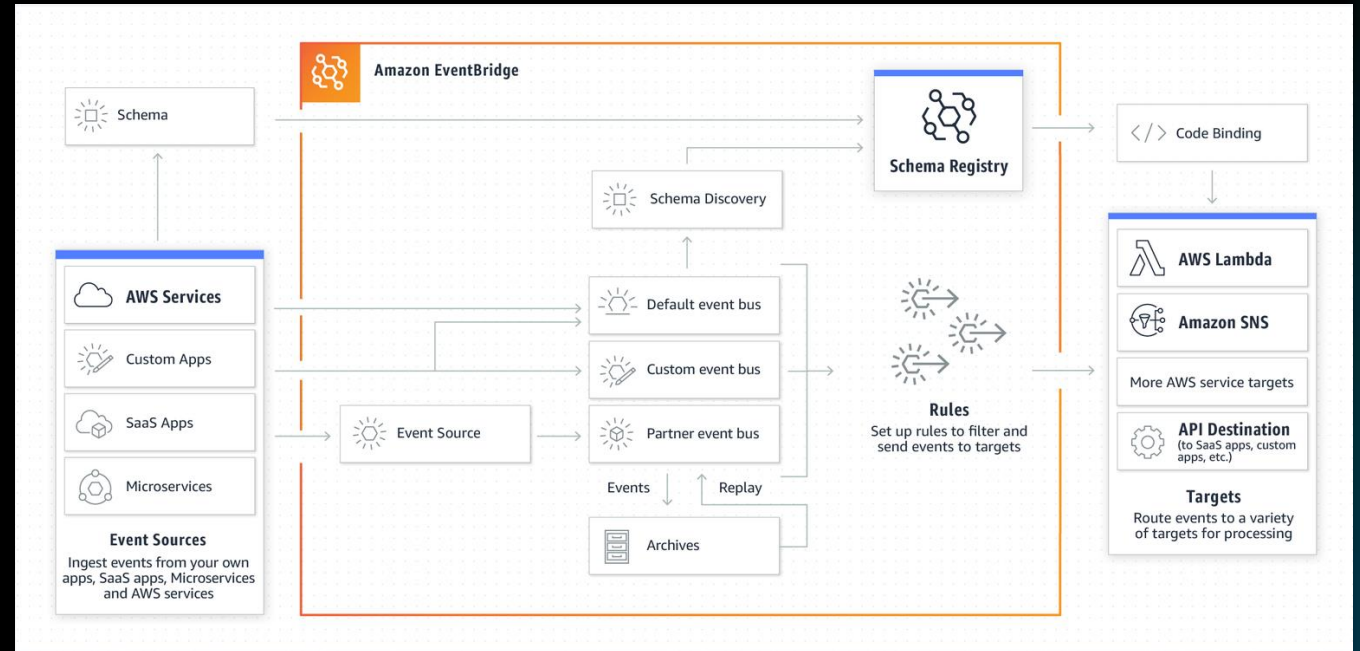

Observable events

Choreograph events *between domains* using subscriptions

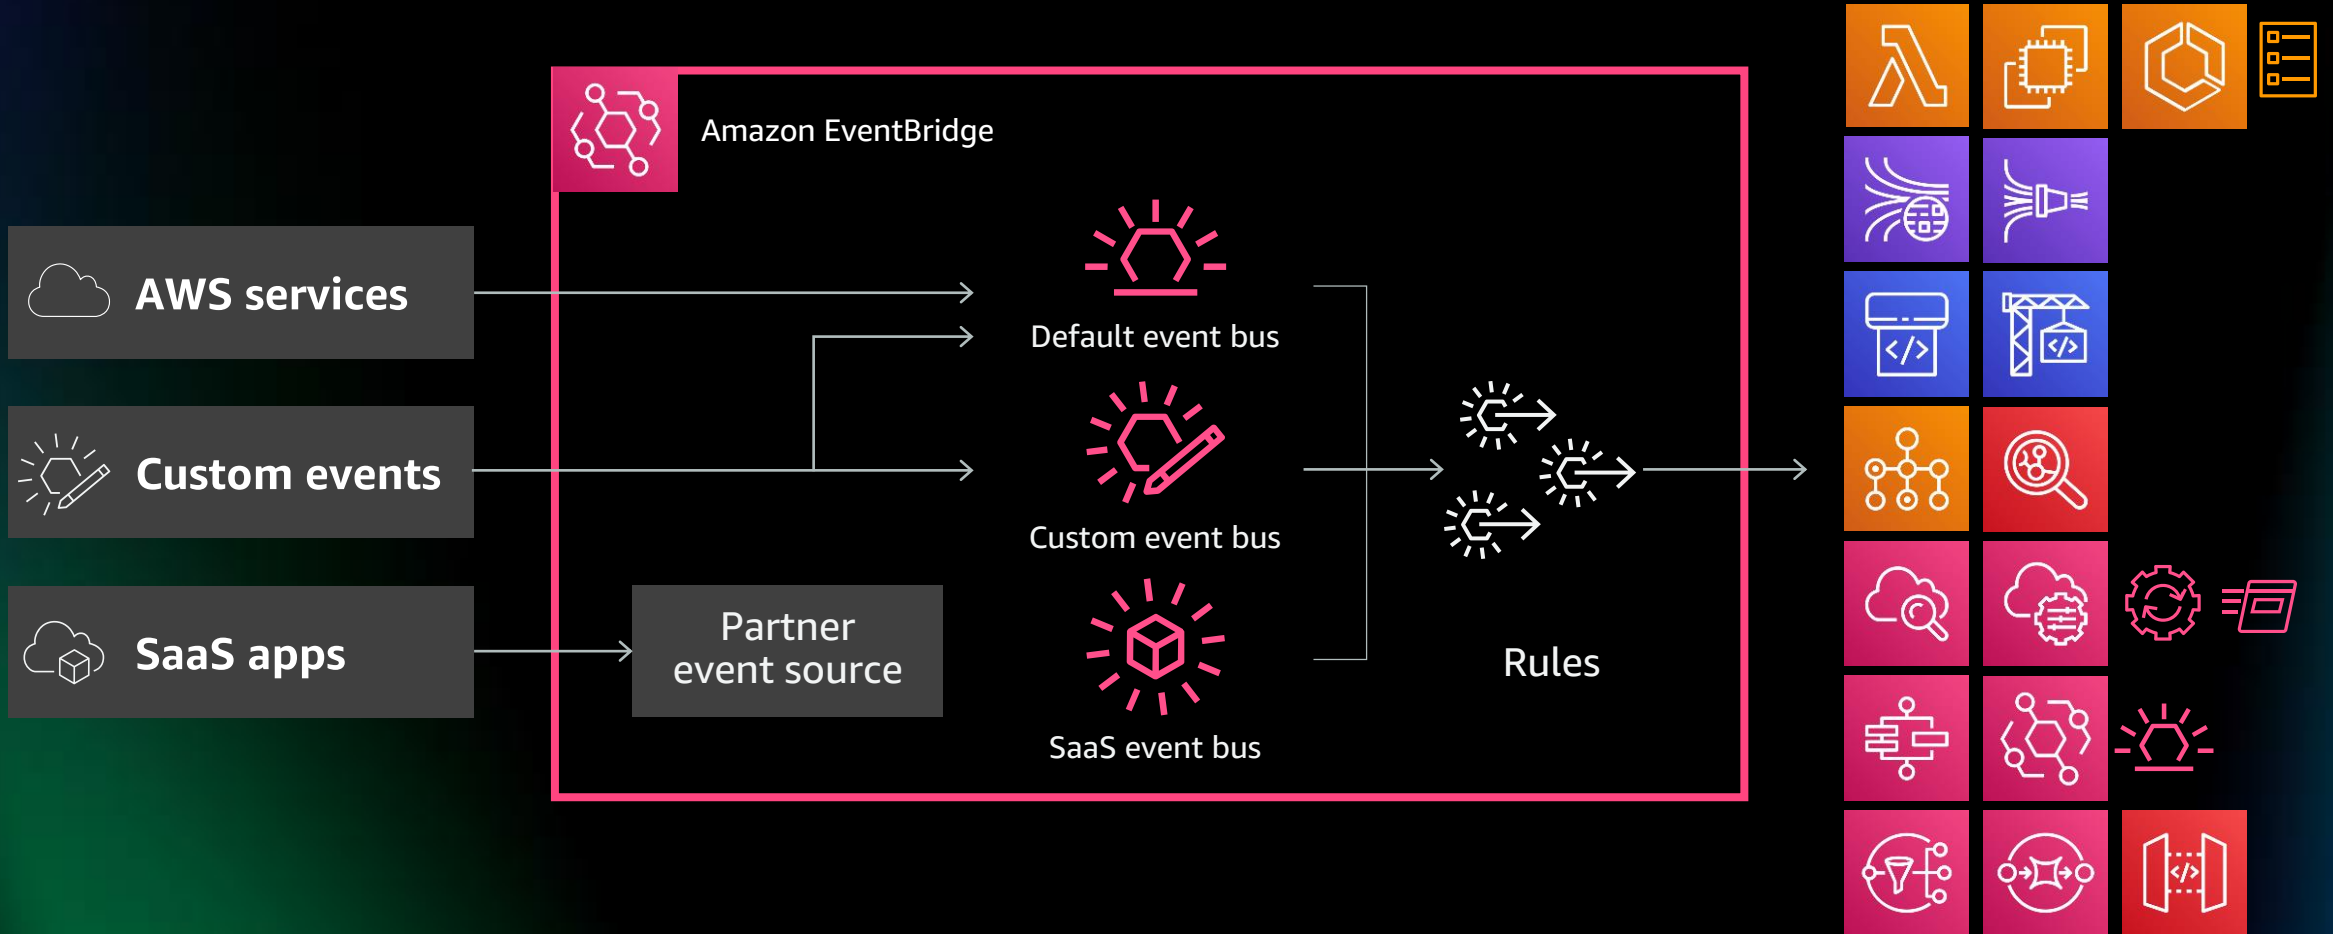

Amazon EventBridge - as an event router

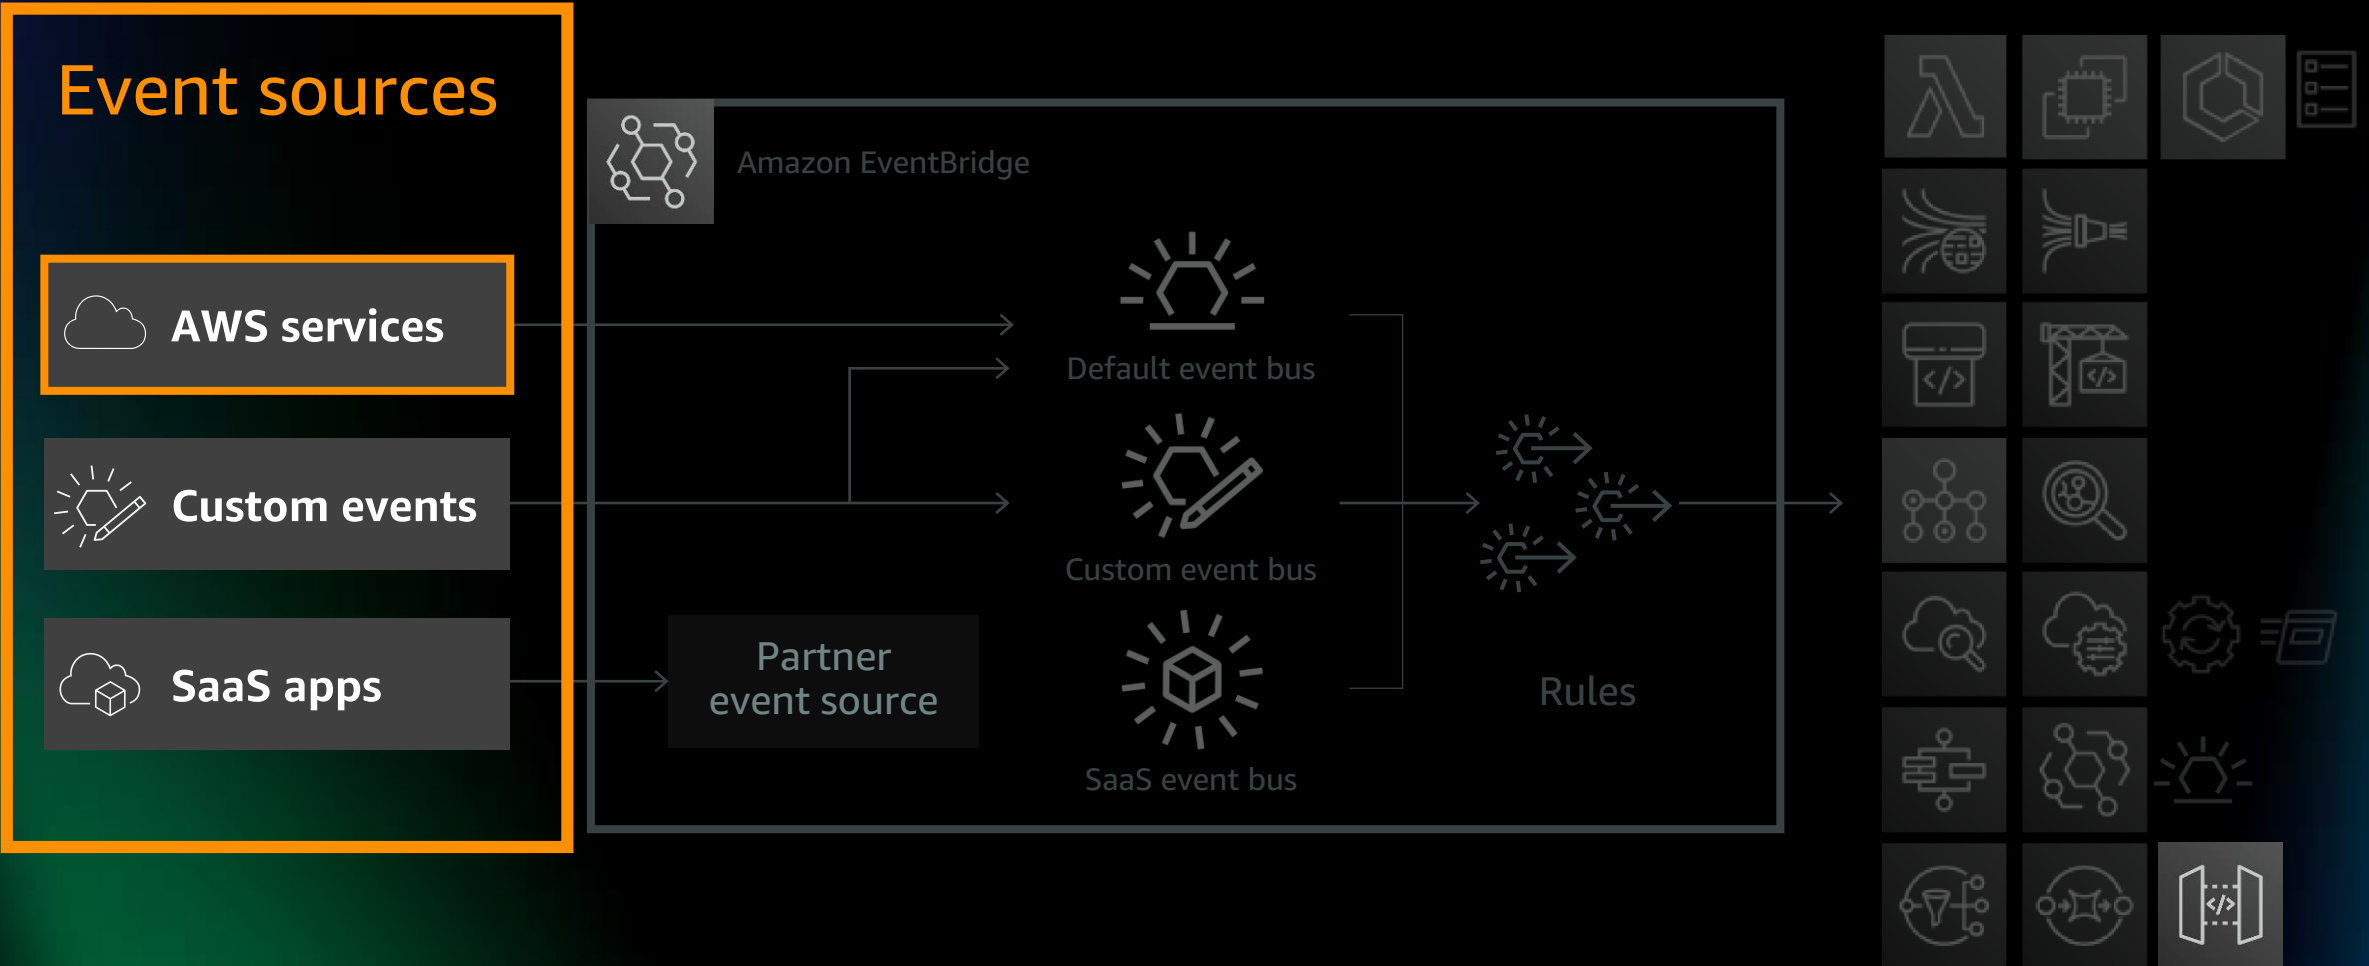

Amazon EventBridge is a simple, flexible, fully managed, pay-as-you-go **event bus service** that makes it easy to ingest and process data from **AWS services, your own applications, and SaaS applications**.

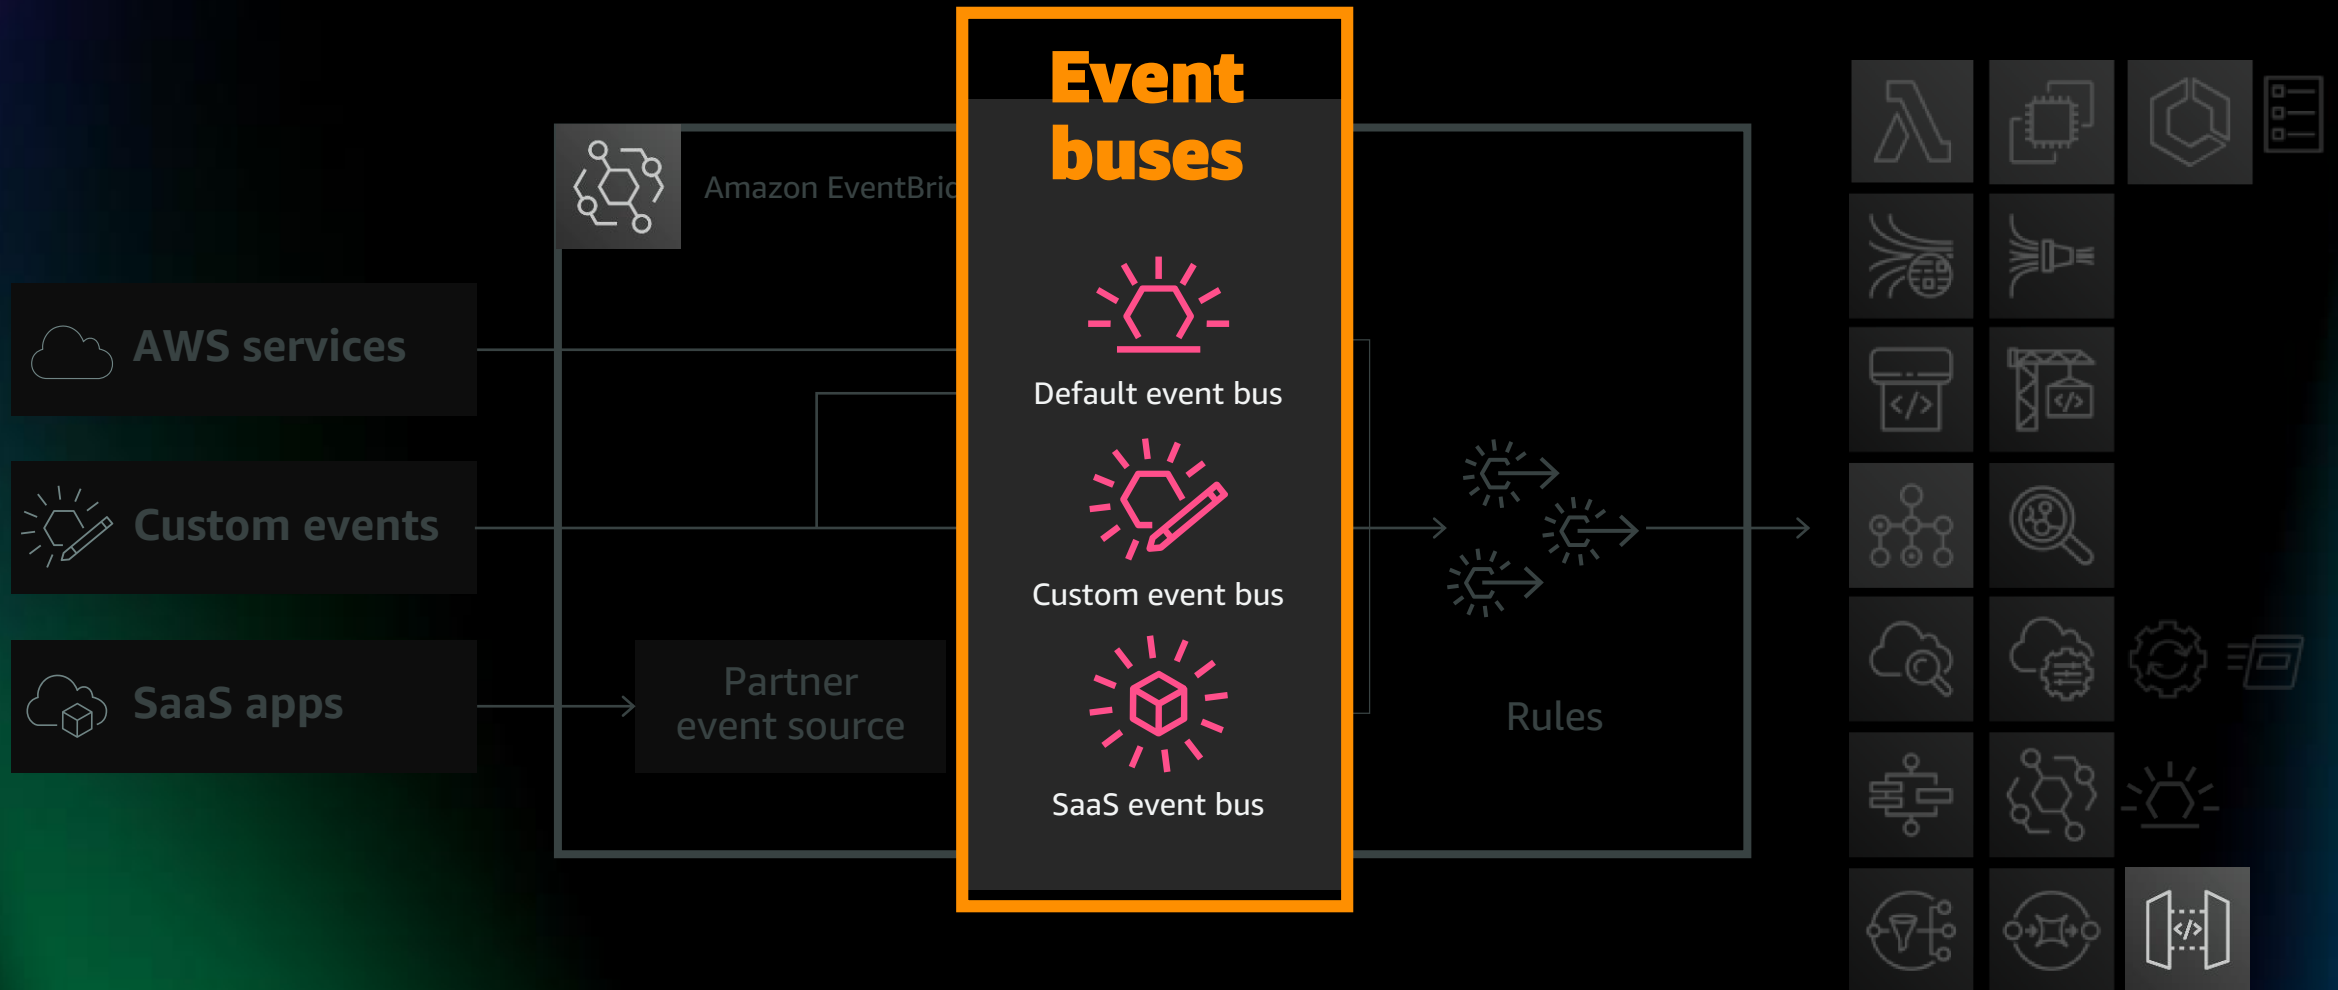

Amazon EventBridge architecture

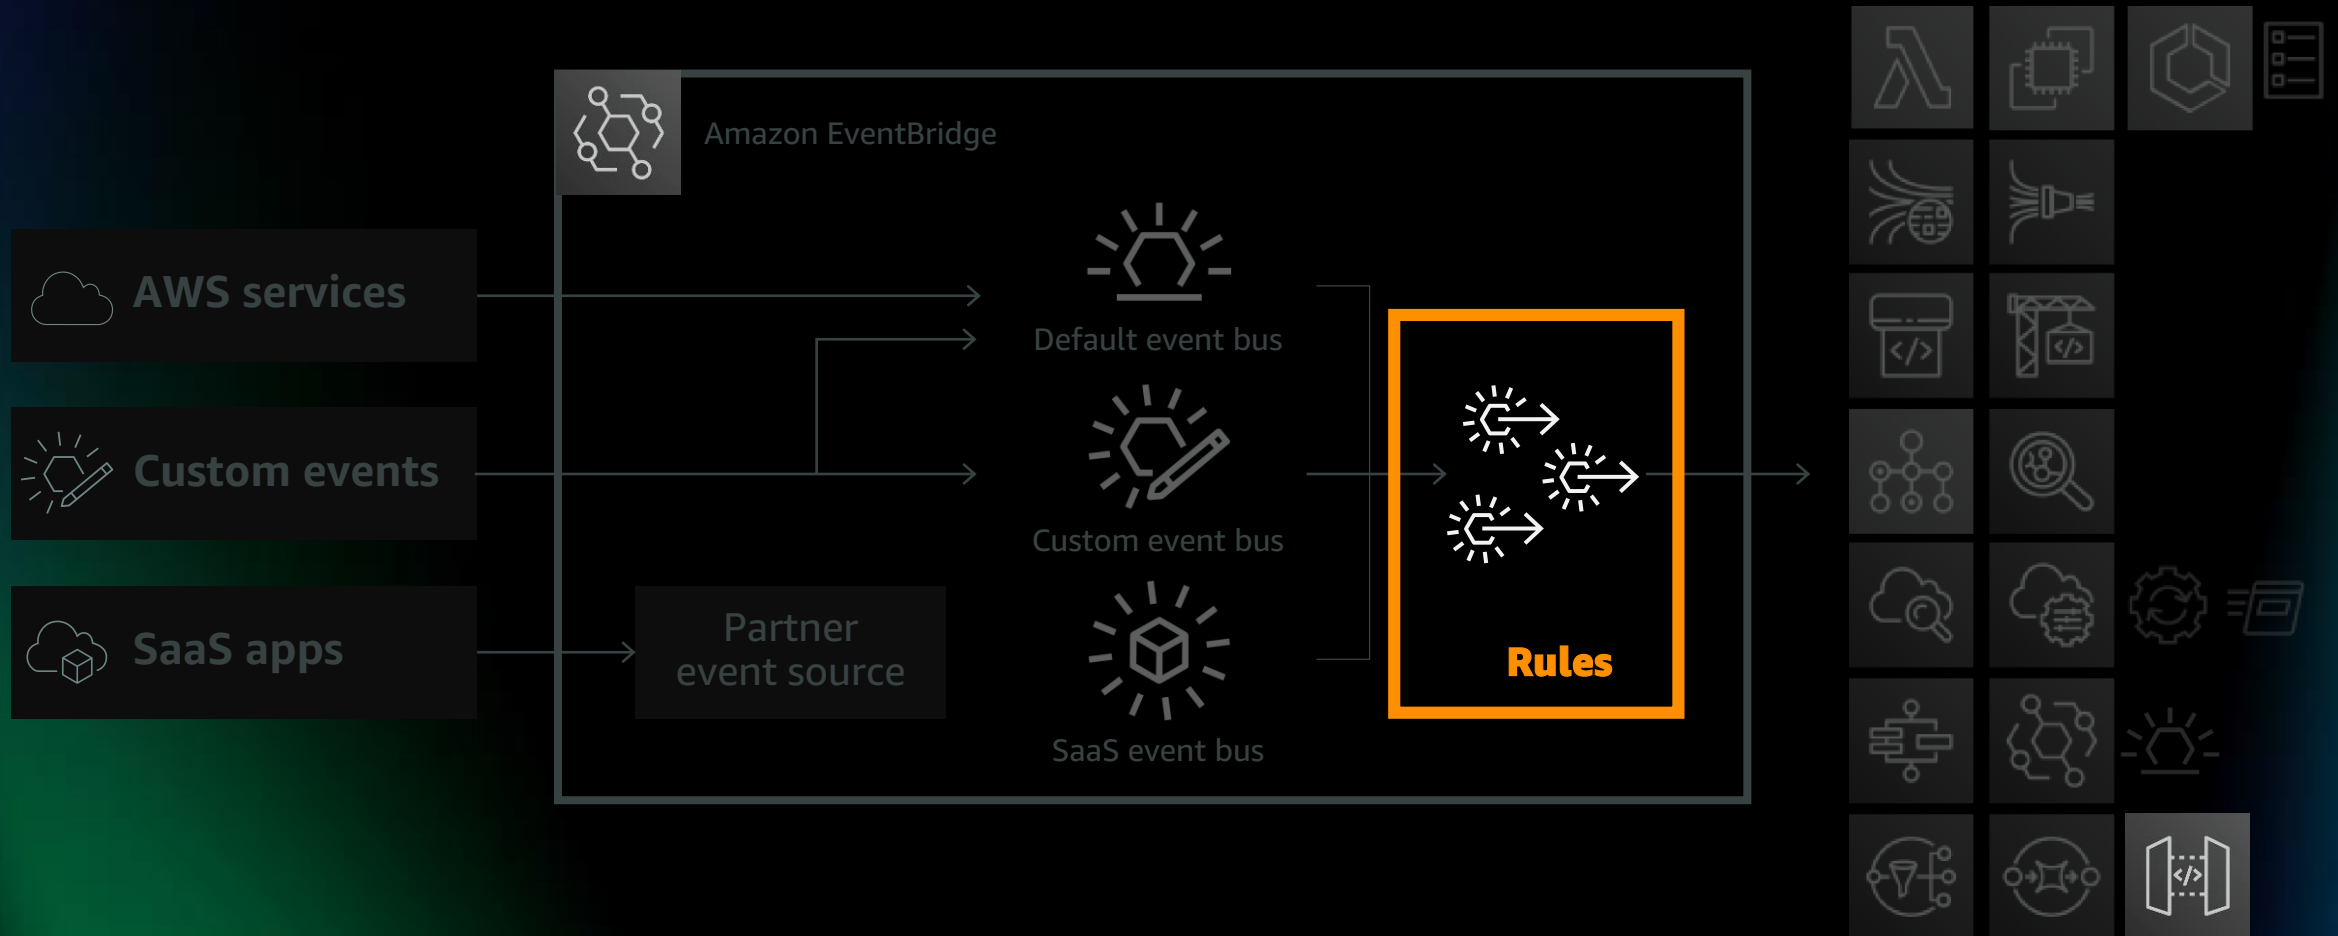

Amazon EventBridge architecture

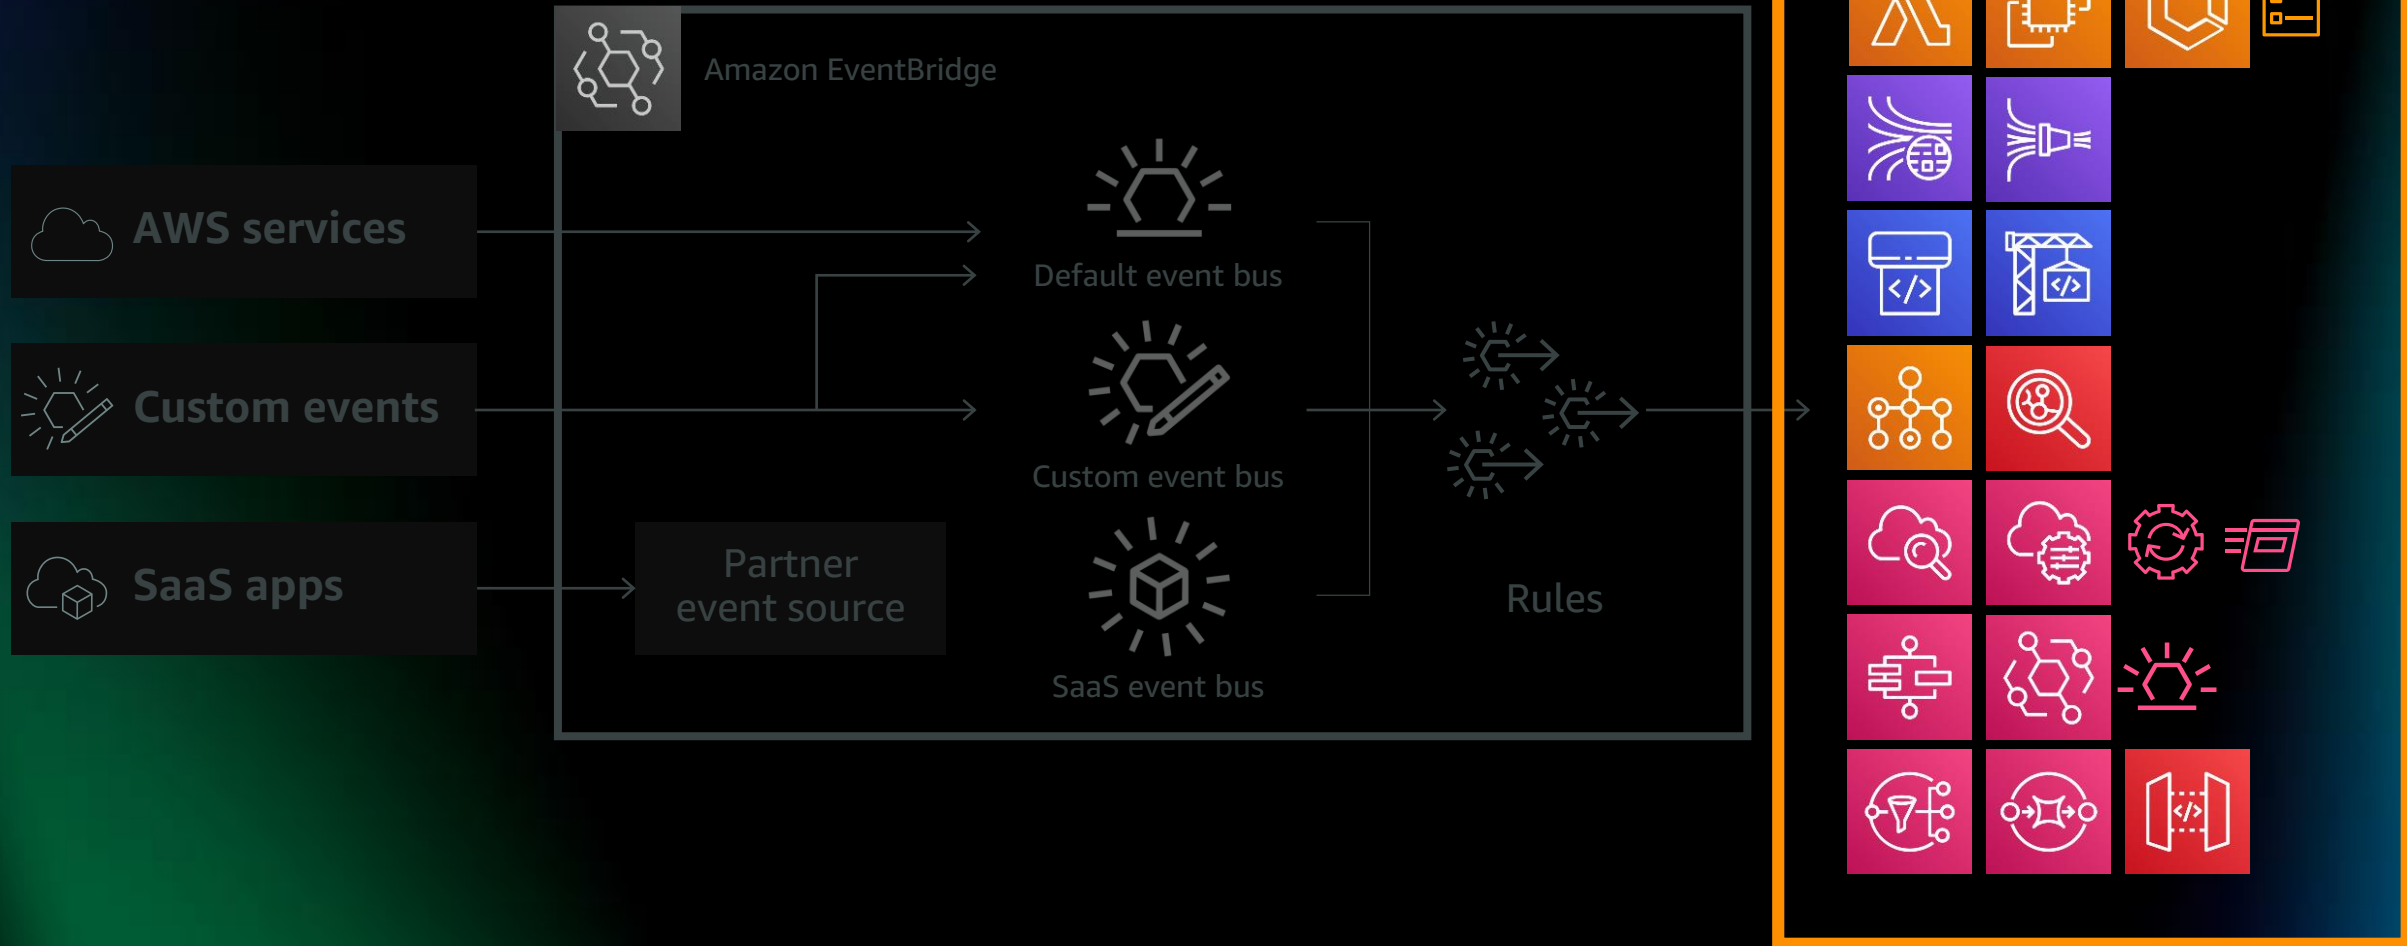

Amazon EventBridge

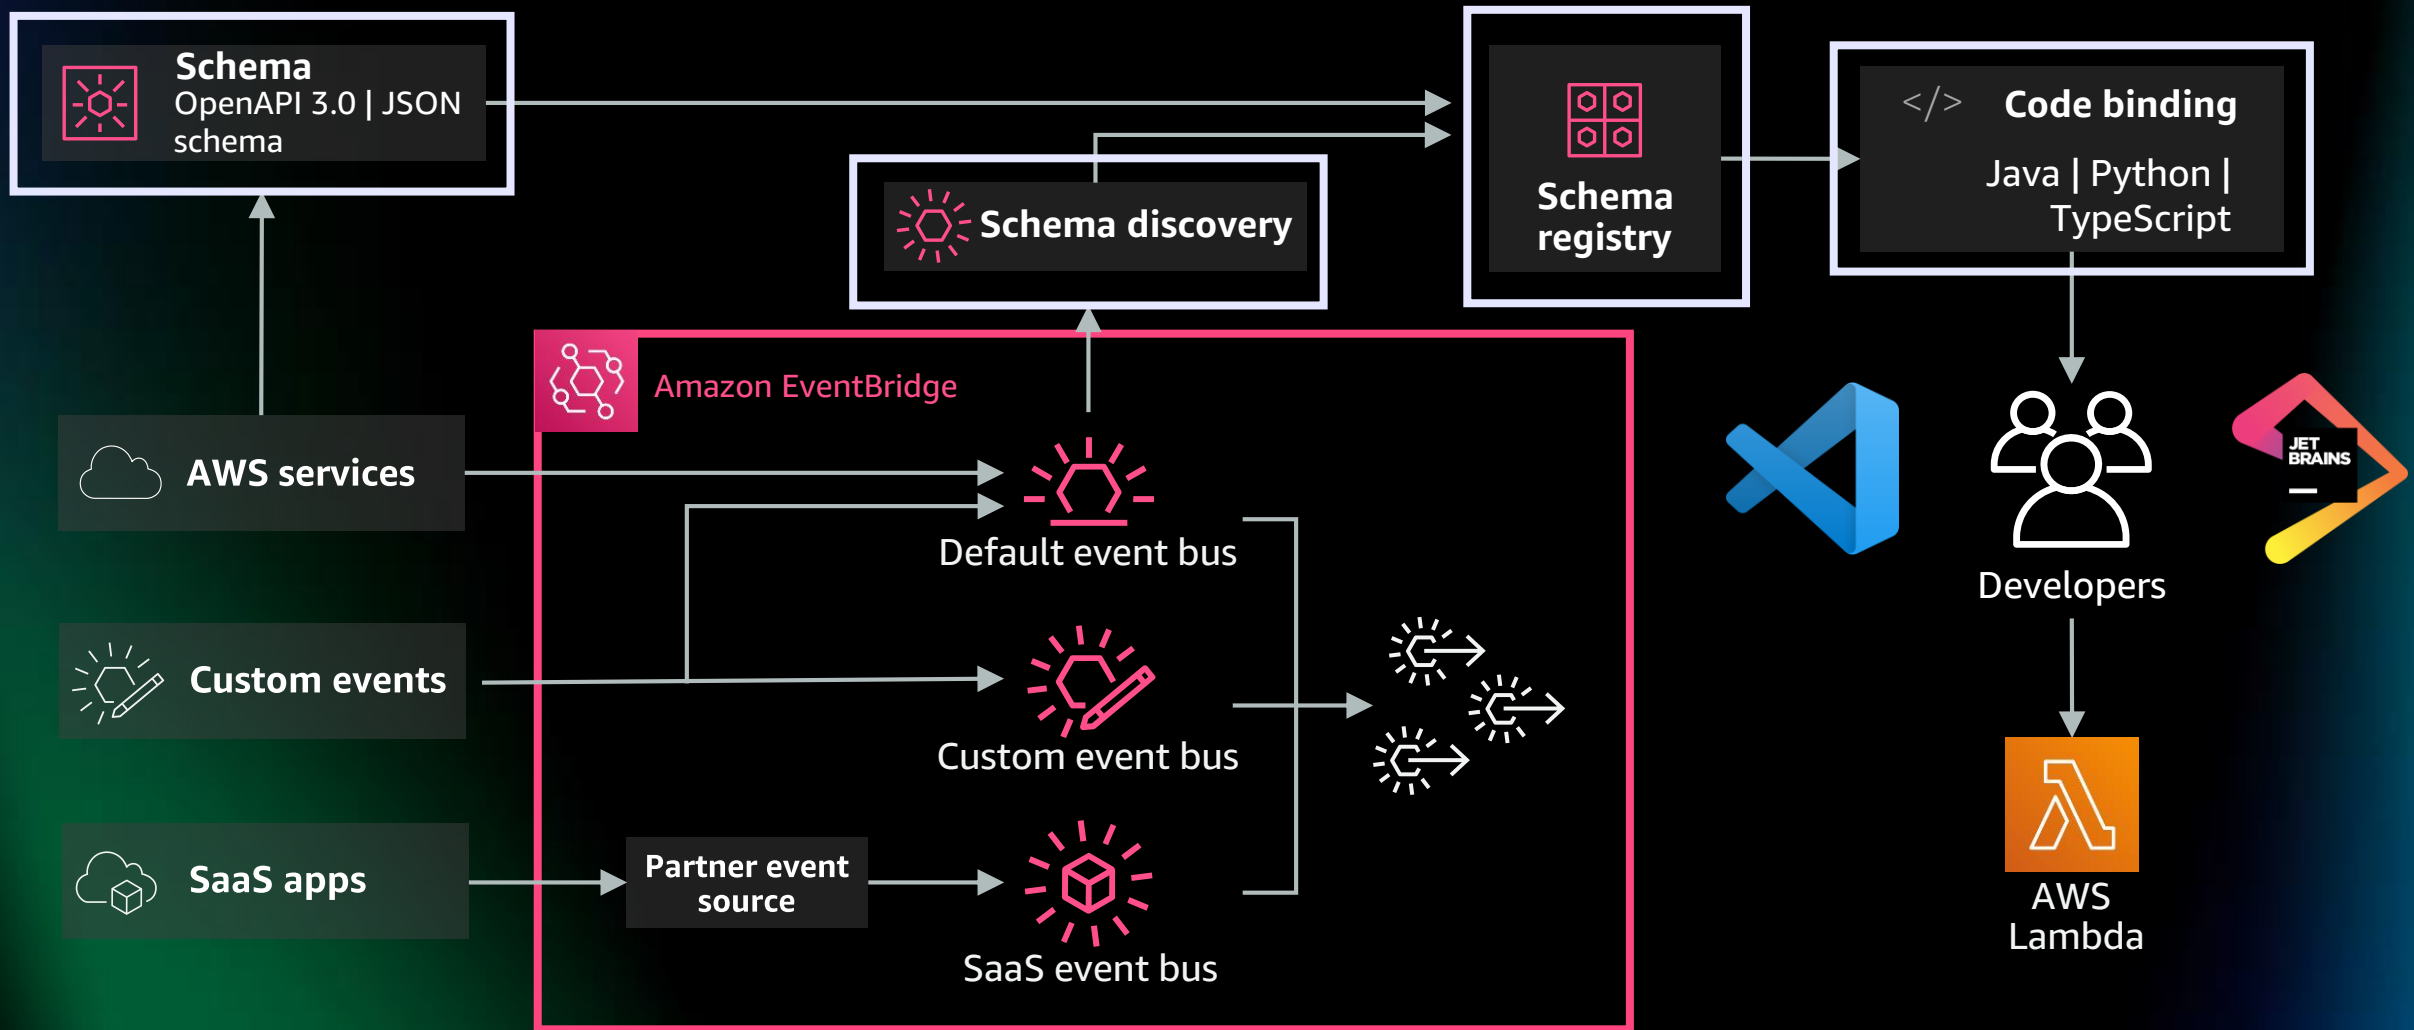

Amazon EventBridge

Amazon EventBridge

Amazon EventBridge Schema Registry

Amazon Simple Notification Service (Amazon SNS)

Fully managed pub/sub messaging for microservices,
distributed systems, and serverless applications

Amazon Simple Notification Service (Amazon SNS)

- Publish / subscribe messaging
- Messages are published to a Topic with multiple subscribers – “fan out”
- High throughput, highly reliable message delivery
- Messages can be filtered and only sent to certain subscribers

Journey to event-driven architectures

STEP 1

Start with the domain

STEP 3

Pick an event store

STEP 2

Coordinate events
with an event router

Improve resiliency and scalability with event stores

Buffer messages until services are available to process them

Amazon Simple Queue Service (Amazon SQS)

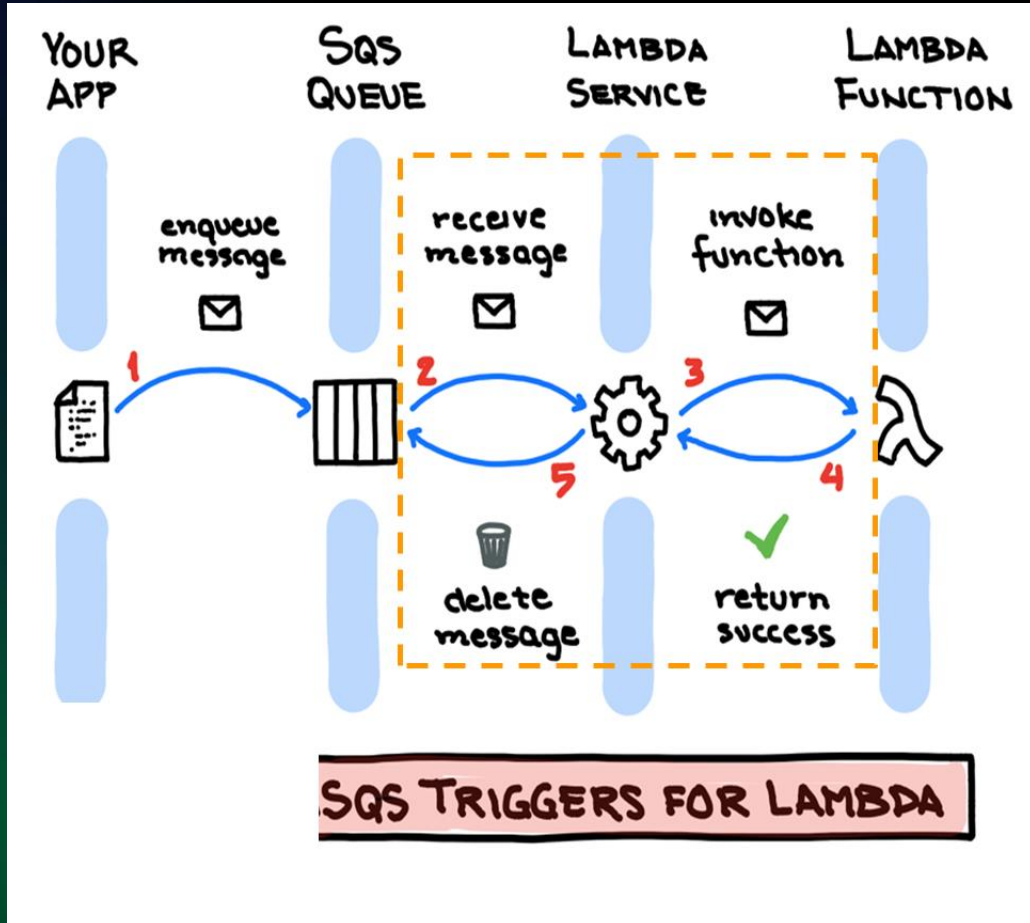

Fully managed message queuing service that enables you to decouple and scale microservices, distributed systems, and serverless applications

Amazon Simple Queue Service (Amazon SQS)

- Any volume of messages
- Messages processed in batches
- At least once delivery with standard queues, exactly once with SQS FIFO queues
- Visibility timeout allows handling failures
- Service **long-polls** queues

Amazon SQS as an AWS Lambda event source

Before:

- **Customer** wrote a service to poll an Amazon SQS queue including logic to back off polling, delete message, etc.
- Customer monitored, scaled, and maintained

After:

- **AWS Lambda** service is **managing** message polling, scaling of consumers, receiving messages, passing on to AWS Lambda function, and deleting messages

Result:

- Customers write and manage less code
- Customers leverage Amazon SQS and AWS Lambda together to automate functions

Facts:

- Amazon SQS is the #1 event source for AWS Lambda

Journey to event-driven architectures

STEP 1

Start with the domain

STEP 3

Pick an event store

STEP 2

Coordinate events
with an event router

STEP 4

Structure events

Sparse events vs. full state descriptions

Order 123 was created at 10:47 by customer 456

Events

Order 123 was created at 10:47 by customer 456. The current status is Open, the total was \$237.51, the items were ...

Full-state description

Considerations with sparse events

Order 123 was
created by
customer 456

What are the
details for
order 123?

Considerations with full-state descriptions

```
{
  "source": "com.orders",
  "detail-type": "OrderCreated",
  "detail": {
    "metadata": {
      "idempotency-key": "c1b95b88"
    },
    "data": {
      "order-id": "1073459984",
      "status": "Open",
      "total": "237.51"
    }
  }
}
```

- Event schemas should be backwards compatible
- Cost to calculate values can increase over time

Review

STEP 1

Start with the domain

STEP 3

Pick an event store

STEP 2

Coordinate events
with an event router

STEP 4

Structure events
